

Modeler 6.1.2 Release Notes

Changes since 6.0.5:

Fixed

- 7034: Check in and Check out causes exception "object reference not set to an instance of an object"
- 7031: Deleting the parent from the library picker causes a RTE
- 7026: Hyperlink region does not work in static website
- 7025: Cancelling a 'confirm cancel' dialog and then pressing OK results in a RTE for multiple dialogs
- 7024: Saving a library with diagram items Related Hidden RTE's when showing items
- 7023: Saving a Process Diagram with Display Actors sets the AAXNDiagramInitiationExchange.isHiddenFlag
- 7015: The setFieldValue method on FreeItem fails to stop rename over an existing item name
- 7013: RTE on relationship sync
- 7011: Item editor/dialog on creation does not load options from default template
- 7003: Anonymous scripts and diagram item contents can't reference Packages
- 6998: Prereq version binding does not detect new versions of prereqs two or more levels deep
- 6987: After invoking a delete op on an item, and choosing the Mark As Deleted option, Mark As Changed is not set
- 6979: The same library can be checked-in twice from two different machines by two different users
- 6799: Query Catalogs won't show alias name in team working libraries
- 6771: RTE dnu "picture" when changing the diagram's page orientation
- 6624: Error Code 100, "Invalid Session Handle"
- 7032: Seemingly wrong tree node edited with F2 or Rename
- 6988: Updating a task using the owning item's editor doesn't update the task in the Reporting Area's Task view - resulting in inconsistent/different properties, depending which editor you open
- 6986: Marked-as-read-only items do not retain this property in team working libraries (or when they are in a layer) - The item owner _can_ copy items to working layer, with the result that the Marked-as-read-only is cleared
- 6944: F5 does not do the job like "Refresh" to update library model in the Area view
- 6936: Library cannot be checked in by a Model Administrator other than the one who originally checked it out when the team folder was added/indexed 'on the fly'
- 6882: Business Process Area Diagram with wrong diagram tools: non-SRAF "Process Area Diagram" and non-SRAF "Process Diagram"
- 6844: Item picker loses existing selection when new item is created
- 6283: Cannot select published images from Add Link's item picker

- 5525: New version of a library that already exists in the repository (same uuid) cannot be checked-in using the option "initial version" - also, the failure message only gives cryptic uuid, user doesn't know which library failed
- 5360: Query catalog's sort order cannot be set. Selecting "Sort By Order" should sort the query catalog's contents according to the script's output/return lists's sorting order.
- 6933: Script Editors short cut keys don't work in main view area
- 6164: Saving a script that's has implementation concealed set to true replaces code

Enhancements

- 6708: Catalog sort order should be consolidated
- 6475: Deleting from the Recently Opened list on the Start page should only delete the shortcut, not the file
